

design of pelton turbines pdf

The Pelton wheel is an impulse-type water turbine. It was invented by Lester Allan Pelton in the 1870s. The Pelton wheel extracts energy from the impulse of moving water, as opposed to water's dead weight like the traditional overshot water wheel. Many variations of impulse turbines existed prior to Pelton's design, but they were less efficient than Pelton's design.

A turbine converts energy in the form of falling water into rotating shaft power. The selection of the best turbine for any particular hydro site depends on the site characteristics, the dominant ones being the head and flow available.

Hydropower basic: introduction

A turbine (from the Latin turbo, a vortex, related to the Greek ἄλμα, tyrbÄ“, meaning "turbulence") is a rotary mechanical device that extracts energy from a fluid flow and converts it into useful work. The work produced by a turbine can be used for generating electrical power when combined with a generator. A turbine is a turbomachine with at least one moving part called a rotor assembly ...

Turbines used in thermal powerplants :-Also called as steam turbines, they are used in nuclear & thermal powerplants where water is heated to form steam & then flowed through turbines to produce electricity. Alike water turbines, steam turbines are also classified into impulse & reaction types but the arrangement & design is different.

Hydro Energia and the environment Hydro Power is well known as a renewable energy source for the daily needs of our families and industries, with a very low impact on the environment and wildlife compared with possible alternative sources, both in terms of construction and operation as well for long-term life cycle assessment.

Here are some good references for planning, designing, and building a micro-hydro system. Step zero is to carefully determine if you have a hydro resource that is worth developing -- some of the references cover how to do this in detail.

Le principal avantage des turbines à vapeur est d'être un moteur à combustion externe. De ce fait, tous les combustibles (gaz, fioul, charbon, déchets, chaleur résiduelle) et notamment les moins chers peuvent être utilisés pour l'alimenter en vapeur. Le chauffage peut même se faire par énergie solaire. Le rendement peut atteindre des valeurs assez élevées des frais de ...
