Differences between Shunt Reactor and Power Transformer Thus, there are more than one winding on a Power Transformer with magnetic core which carry the mutual flux between the two. In reactor there is just one winding .

Differences Between Shunt Reactor and Power Transformer

A shunt reactor is an absorber of reactive power, thus increasing the energy efficiency of the system. It is the most compact device commonly used for reactive power compensation in long high-voltage transmission lines and in cable systems.. Series reactors are mostly used to limit the current and to increase the impedance.

Differences Between Shunt Reactor and Power Transformer

shunt reactors may greatly differ between utilities. Reactors can be placed on a section of the transmission line or on the adjacent bus. Current transformers (CTs) may be installed on the reactors, or the line protection devices may rely on bus CTs. Each philosophy presents challenges for reactor, line, and/or bus protection schemes.

Impacts of Shunt Reactors on Transmission Line Protection
